I've read some explanations of how autocorrelation can be more efficiently calculated using the `fft` of a signal, multiplying the real part by the complex conjugate. autocorrelation . What is the reason why the autocorrelation (`autocor.m`) is computed with a `for` loop rather than using `fft`? This is a function that does it for `a`. and zero for `.` In matlab, the sample autocorrelation of a vector `x` can be computed using the `xcorr` function. 7.3. Example: `octave :1> xcorr ([1 1 1 1], 'unbiased')`
